

## **MAPS**

### **INTRODUCTION**

This subsection contains a series of maps that describe administrative boundaries, resources, and resource problems existing in California and the area serviced by the NRCS Field Office. Other maps on file in the office will be referenced here with their location indicated.

Administrative maps include those that show the area serviced by the NRCS office, Resource Conservation Districts (RCD), Congressional and other special districts, state and federal agency jurisdictions, and spheres of influence for major cities and towns established by the Local Agency Formation Commission (LAFCO).

Resource maps include those that show land use, general soils data, Major Land Resource Areas (MLRA), average annual precipitation, topography, wetlands, riparian areas, climate zones, and frost-free periods.

Resource problem maps include those that show resource problems identified by some agency or organization that may affect resource management in the area, including polluted waters maps (CA State 303(d) lists) and Total Maximum Daily Load (TMDL) Priority maps.
